It should be available for free.

## PANEL DIAGRAM

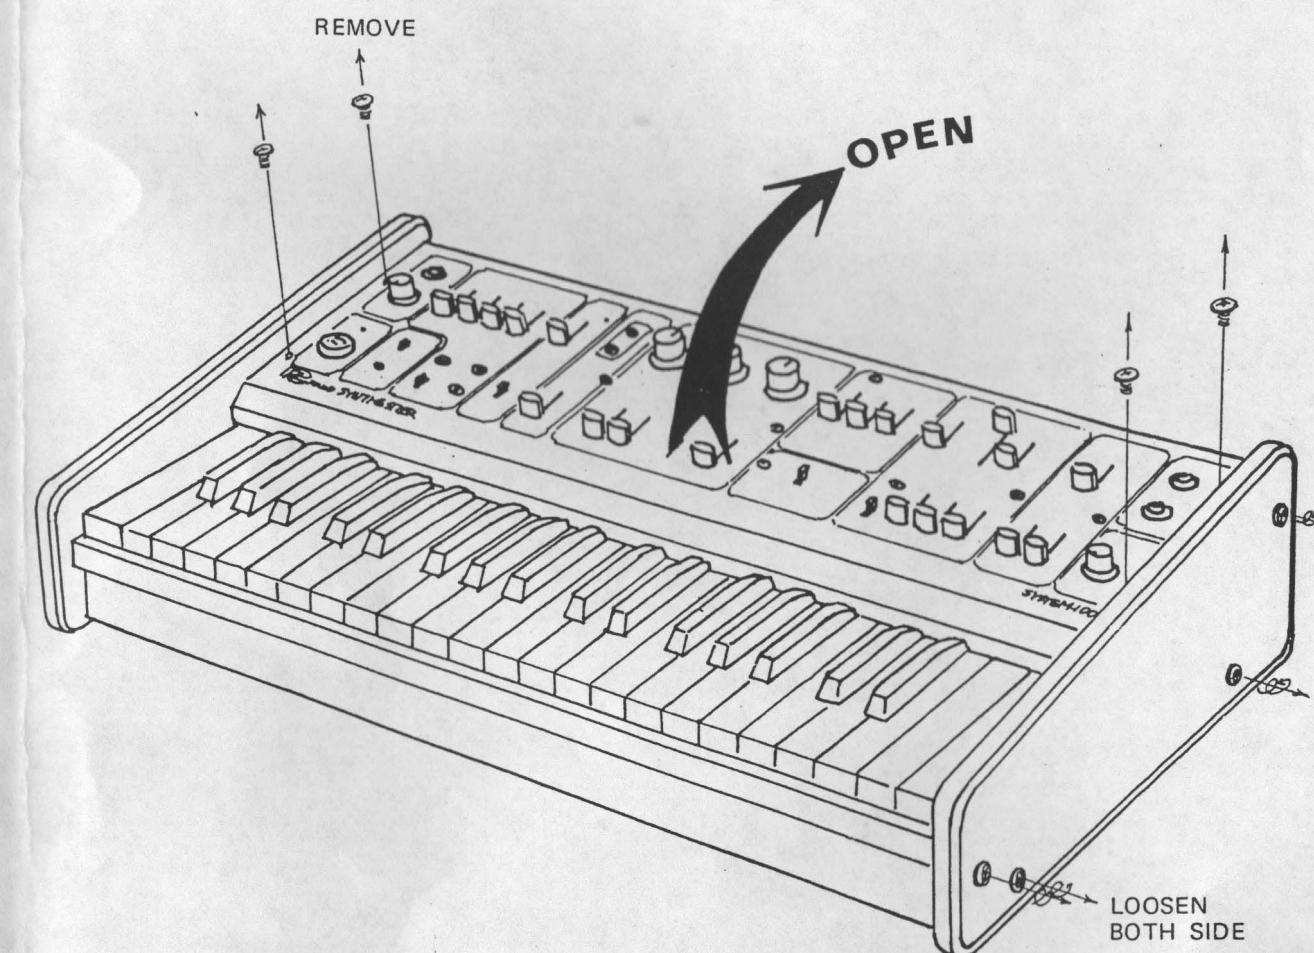

## DISASSEMBLY

System-100, Model-101 can be disassembled in the following steps when necessary for checking and readjustment.

The power cord must be disconnected from the power source before proceeding with disassembly.

Remove the panel board screws (2 each on both sides of right and left) from the Control Panel, and also the side board screws (4 each on both sides) from the side board. With all done, the Panel Board can be opened by lifting upward.

Harness the Panel Board with a string or else through holes on both sides of the right and left on the reverse side of the Panel, to those holes on the side board, so as to prevent the Panel Board from falling back too far on procedures afterward.

# SYSTEM-100 SPECIFICATIONS

**MODEL-101**
**1. VCO (Voltage Controlled Oscillator)**

Frequency Range: 3 Hz – 40 KHz  
 VCO Output: 10 Vp-p  
 VCO Sync. Output: Pulse Wave

**CONTROLS**

Wave Form: Triangular Wave, Sawtooth Wave, Square Wave, Pulse Wave (Pulse Width Controlled)  
 Frequency: 10 Hz – 10 KHz (at A2 key) continuously variable  
 Fine Tuning: 1 oct.  
 Pulse Width: 5% – 50% (Manual, ADSR, LFO)  
 Ext. CV: 1V/oct.

**LFO**
**2. NOISE GENERATOR**

Pink or White Noise Output: 10Vp-p

**3. AUDIO MIXER**

Ext. Input Impedance: more than 50 Kohm

**CONTROLS**

VCO, Noise, Ext. Input

**4. HIGH PASS FILTER**

HPF Cutoff Frequency: 10 Hz – 10 KHz

**5. VCF (Voltage Controlled Filter)**

Cutoff Frequency Range: 20 Hz – 100 KHz

**CONTROLS**

VCF Cutoff Frequency: 20 Hz – 20 KHz  
 Resonance: 0 – self oscillation  
 LFO/Ext. CV: 1V/oct.  
 Kybd. CV  
 ADSR

**6. VCA (Voltage Controlled Amplifier)**
**CONTROLS**

Initial Gain  
 LFO  
 ADSR

**7. ENVELOPE GENERATOR (ADSR)**

ADSR Output: +6V (contour peak)  
 Ext. Env. Input: same as above  
 Ext. Gate Input: +14V  
 ADSR Trig.: KYBD Gate or LFO

**CONTROLS**

Attack Time: 0.4 msec. – 3 sec.  
 Decay Time: 0.8 msec. – 6 sec.  
 Sustain Level: 0 – 100% (contour peak)  
 Release Time: 0.8 msec. – 6 sec.

**8. LFO (Low Frequency Oscillator)**

Wave Form: Sawtooth Wave, Sine Wave, Square Wave

**CONTROL**

LFO Frequency: 0.15 Hz, – 25 Hz

**9. GLIDE**

Auto Glide  
 (Key Trig. ON/OFF): Semi Tone  
 Glide Manual:

**10. KEYBOARD CONTROL VOLTAGE**

KYBD CV Output: 1 V/oct.  
 KYBD Gate Output: +14V

**CONTROL**

Portamento: 0 – 2.5 sec.

**11. STANDARD OSCILLATOR**

A-440 Hz

**12. AUDIO SIGNAL OUTPUT**

High Output: 3 Vp-p with 1 Kohm output impedance.  
 Low Output: 0.3 Vp-p with 1 Kohm output impedance.

**13. HEAD PHONE OUTPUT**

0.3V max into standard 8 ohm stereo headphones.

**14. KEYBOARD**

37-key

**15. FOR COMPUTER**

CV Input: 1 V/oct.  
 CV Output: Keyboard Control Voltage 1V/oct.  
 Trig. Input: +14V  
 Trig. Output: +14V

**16. DIMENSIONS AND WEIGHT**

Overall Size: 610 m/m wide, 355 m/m deep, 145 m/m high.  
 Net Weight: 9 kg.

**17. POWER REQUIREMENTS**

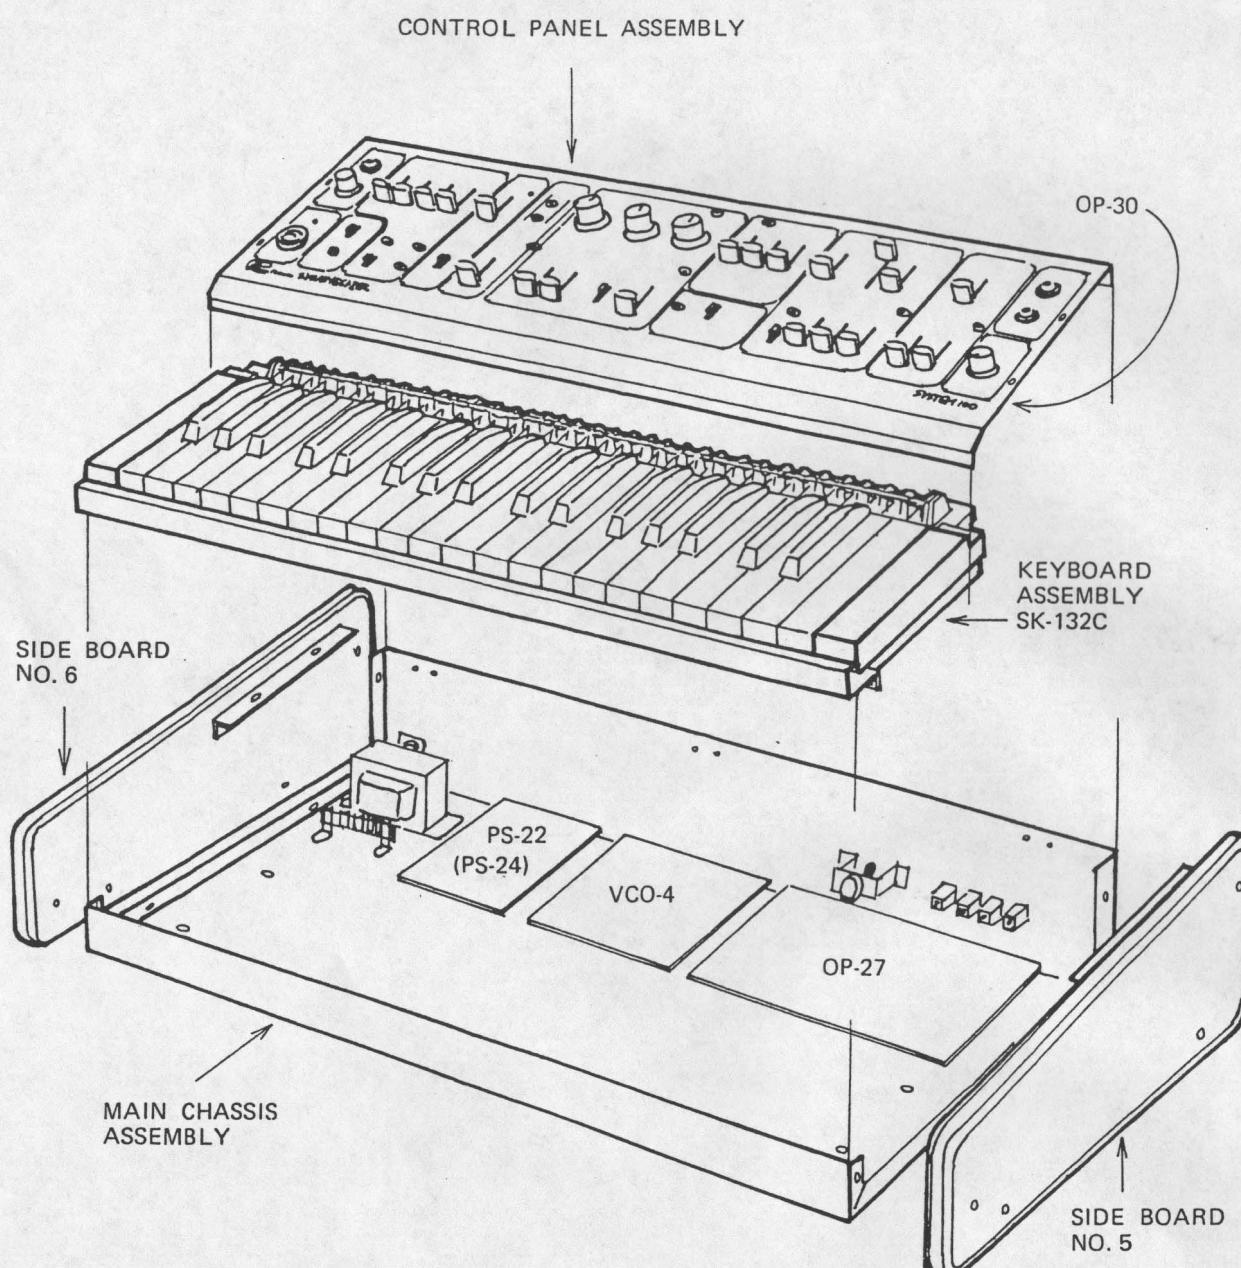

100 – 120V 50 – 60Hz:  
 220 – 250V 50 – 60Hz:

**18. POWER CONSUMPTION**

10W max.

## GENERAL LAYOUT

## DESCRIPTION of PCB (Printed Circuit Board) ASSEMBLY

## 1. VCO BOARD ASSEMBLY (VCO-4)

VCO Board Assembly is consisted of two main circuits: KEYBOARD CIRCUIT and VCO CIRCUIT.

In KEYBOARD CIRCUIT, there are Keyboard CV (Control Voltage) Circuit and Keyboard Gate Circuit.

- 1-1. Keyboard CV Circuit is the circuit where the constant DC current is applied from the constant current source so as to produce always certain voltage drop (1 V/Oct.) on the Keyboard resistors when the current comes across them.

The voltage therein provided then goes to S & H Circuit (Sample & Hold), where it is so designed to be held until another key is depressed on the Keyboard to have another voltage thus provided to replace the then hold one.

The output voltage from this circuit is then used, after another voltage produced on the Glide Circuit being added, as a control voltage for VCO, VCF, and for Expander (102), etc.

Keyboard Gate Circuit, on the other hand, produces the gate voltage by ON/OFF manuals of the keys and such voltage thus produced is for use as a gate voltage on Envelope Generator and on Expander (102), etc.

- 1-2. VCO is an oscillator having its frequencies controlled by the voltage supplied from the Keyboard or other external sources (Voltage Controlled Oscillator).

Such control voltage from Keyboard or other external sources are firstly mixed up in the Control Voltage Mixer, to be sent afterward to the exponential converter circuit where the voltages so far having a linear increasing ratio receive conversion to those having exponential increasing ratio, thereby to fit for use as a control voltage for frequency oscillator.

Since the VCO is fundamentally a sawtooth wave form oscillator, such other triangular or square wave forms are to be obtained through the Wave Form Converter.

And, on the square wave form converter circuit, the pulse width modulation is also conducted by the control voltage supplied from ADSR, LFO and the Manual, within a variable degree of 5% to 50% of its pulse width.

## 2. VCF-VCA BOARD ASSEMBLY (OP-27)

Included in this Assembly are: VCF, HPF, VCA, Envelope Generator, LFO, Noise Generator Head-Phone Amplifier, and Mixer Amplifier.

- 2-1. VCF is a voltage controlled low pass filter consisting of the ladder type networks with capacitors and transistors: connected as the diode strings and here the control voltages supplied from the Keyboard or other sources provide the variations on the cutoff frequencies through this VCF.

Also, provided here such characteristic as to have a peak at around the frequency cutoff point, varied tone colours can be made obtainable, and by further being capable of self-oscillation in a wide range of frequencies, setting of musical scale here is also possible on following manuals on Keyboard.

- 2-2. HPF is a high pass filter, of a differentiation circuit composed of C & R, and here the cutoff frequencies are made varied following the control variations on the resistor values.

2-3. VCA is a voltage controlled amplifier, having its gain controlled by the voltage supplied from ADSR, LFO and applied on its current source transistor.

2-4. Envelope Generator produces the ADSR triggered by the keyboard gate voltage, the positions of the four sliders in the ADSR section determine the steepness of the curves of each section and level of the envelope.

2-5. Noise Generator is using, as its sound source, white noise appearing upon the junction of the reverse biased transistor, and on use, by further amplifying such noise.

2-6. LFO is a low frequency oscillator for use of modulation, with the Sine Wave, Sawtooth and Square Waves for modulation of VCO, VCF and VCA, while Triangular Wave for Pulse Width modulation.

2-7. Head-Phone Amplifier provides A-class amplified signals through its output transformer.

2-8. Mixing Amplifier mixes the signals from VCA with that of A-440 Hz Standard Oscillator, thus providing the output of the mixed signals from here.

### 3. A-440 HZ OSC BOARD ASSEMBLY (OP-30)

This circuit is a very stable LC Oscillator.

### 4. POWER SUPPLY BOARD ASSEMBLY (OP-22, OP-24)

The assembly is a voltage regulator circuit, to provide the constant voltages of +14V and -14V, and in order to assure of such precise voltage an adjustable trimmer potentiometer is incorporated.

Note: The board PS-22 is for 100V - 200V, while PS-24 for 220V - 240V.

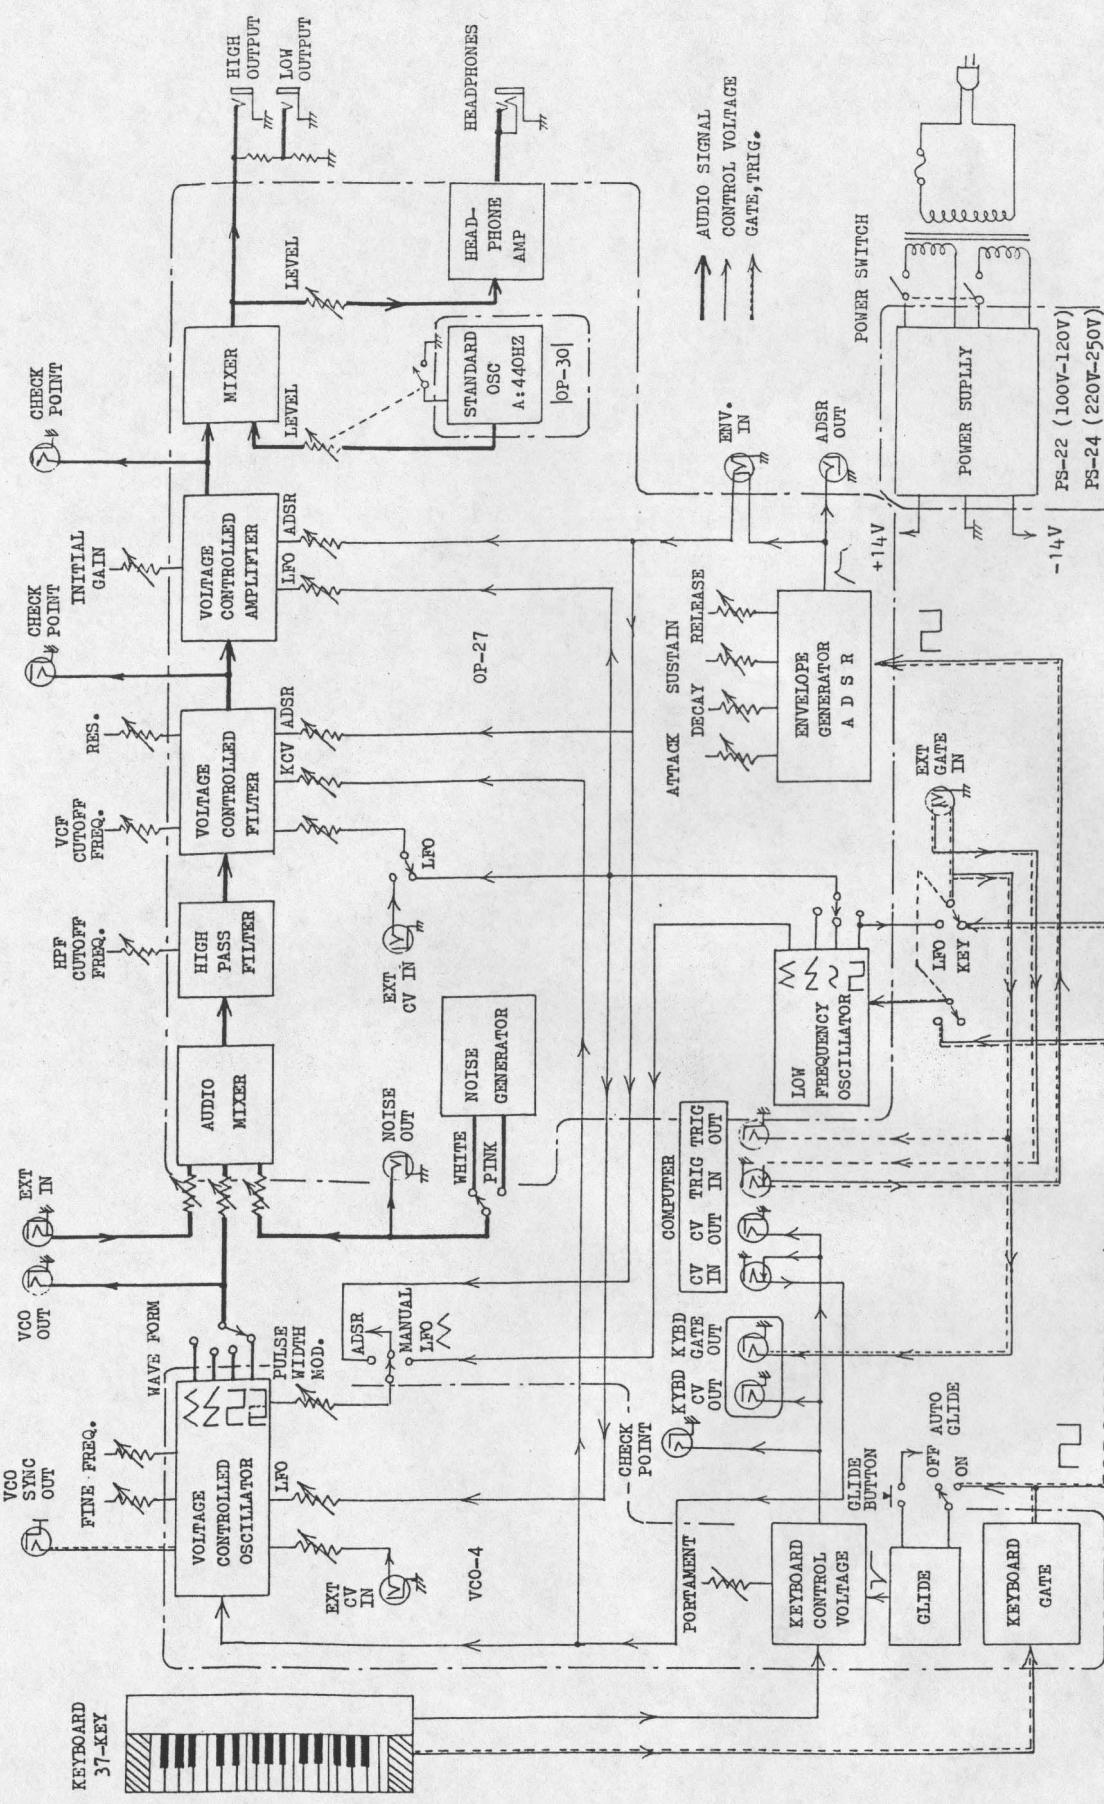

Fuse 0.5A, Fuse Holder TF-758, of Label No. 69, are to be used on PS-24 alone.

For PS-22, use such ones having jumper wire on Fuse Holder.

## SYSTEM 100, MODEL 101 ADJUSTMENT PROCEDURE

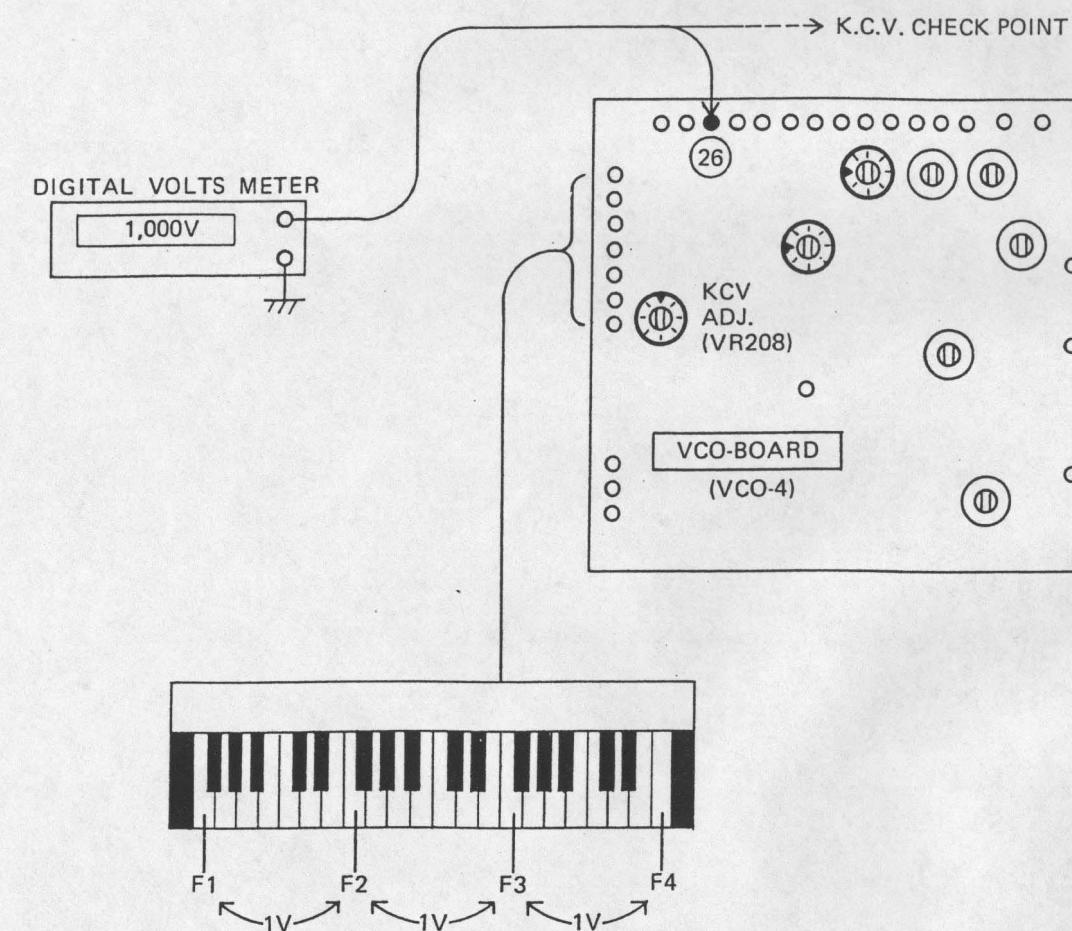

### 1. Power supply Voltage Adjustment:

- a) Connect the Digital Voltmeter to Terminal "10" of the Power Circuit Board (PS-22, PS-24), and adjust VR101 (+14V ADJ.) for reading +14V on the voltmeter.
- b) In the same manner, with connection to Terminal "13", adjust VR102 (-14V ADJ.) for reading -14V.
- c) Tolerance:  $14V \pm 100 \text{ mV}$  can be accepted here.
- d) Digital Voltmeter to be used here must be in accuracy of:  
 Resolution voltage ..... down to DC 10 mV or more  
 Input Impedance ..... 1 Mohm or more

### 2. Key Control Voltage Adjustment:

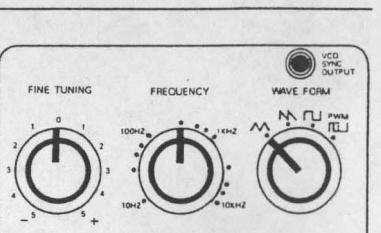

- a) Connect the Digital Voltmeter to Terminal "26" or KCV CHECK POINT of VCO Board (VCO-4), and adjust VR208 so as to have voltage difference of 1V each in between the Keys F1 and F2, and between F2 and F3, then F3 and F4.
- b) Tolerance shall be:  $1V \pm 2 \text{ mV}$
- c) Digital Voltmeter must be in accuracy of:  
 Resolution voltage ..... down to DC 1 mV  
 Input Impedance ..... 1 Mohm or more

## VCO ADJUSTMENT

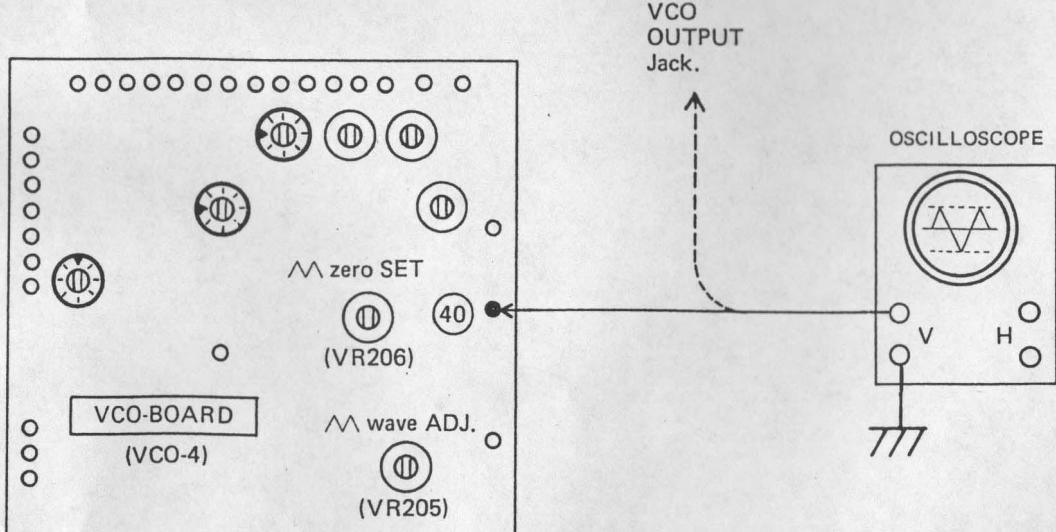

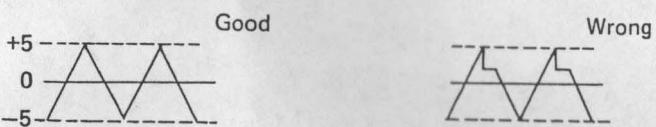

### 1. Triangular ( $\wedge\wedge$ ) Wave Form Adjustment:

- a) Set the Control Panel as shown below.

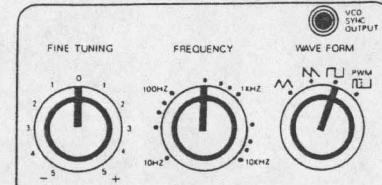

- b) Connect the Oscilloscope to Terminal "40" or VCO OUTPUT JACK, and adjust VR205 (  $\wedge\wedge$  WAVE ADJ.) for the output wave form to be in triangular.

- c) Then, adjust VR206 (  $\wedge\wedge$  ZERO SET) so as to have this output wave form of triangular formed across  $0V \pm 5V$ .

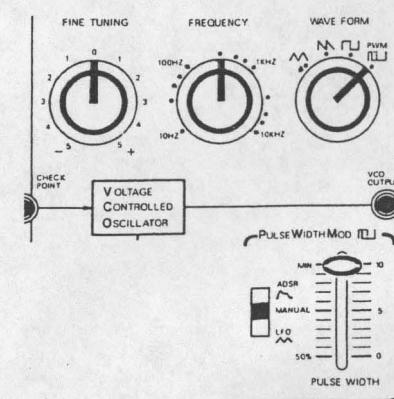

### 2. Square ( $\square\square$ ) Wave Form Adjustment:

- a) Set the Control Panel as shown below.

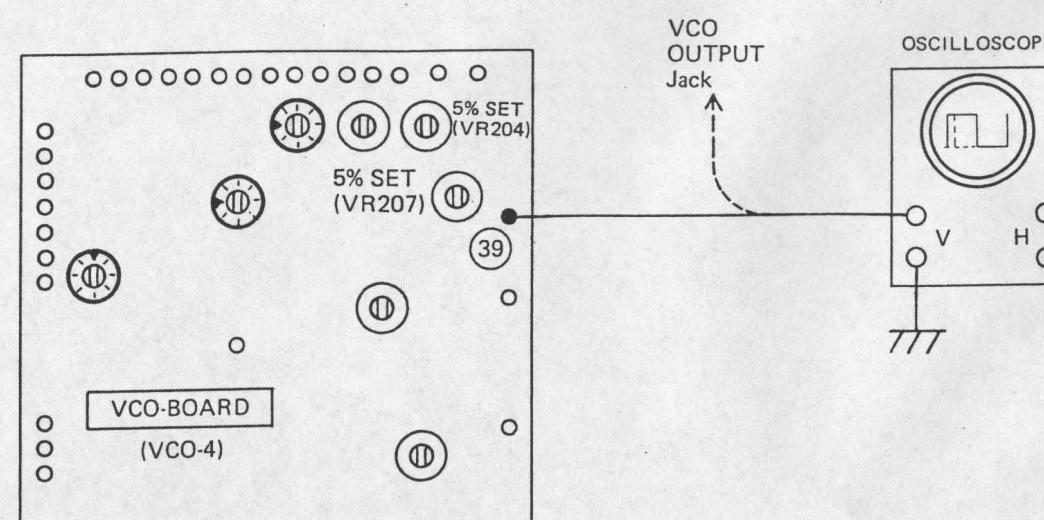

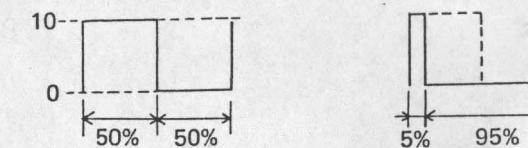

- b) Connect the Oscilloscope to Terminal "39" or VCO OUTPUT JACK of VCO Board (VCO-4), and adjust VR207 (  $\square\square$  50% SET) to have the output wave form in 50% – 50% square wave.

- c) Re-set the Control Panel as shown below.

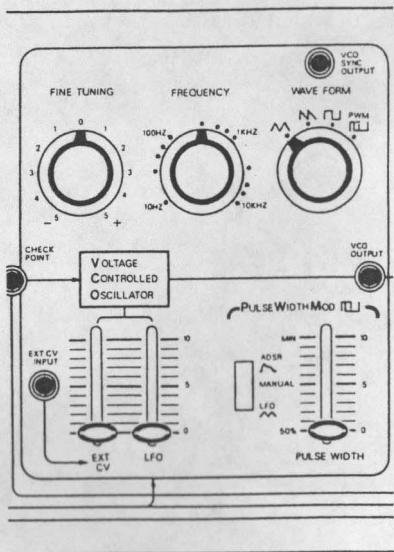

- d) With the same connection as in b) above, adjust VR204 (  $\square\square$  5% SET) for the output now of 5% – 95% square wave.

- e) Check that the wave form does not disappear all the way when VCO-FREQ. on the Control Panel is being turned from 10 Hz to 10 KHz.

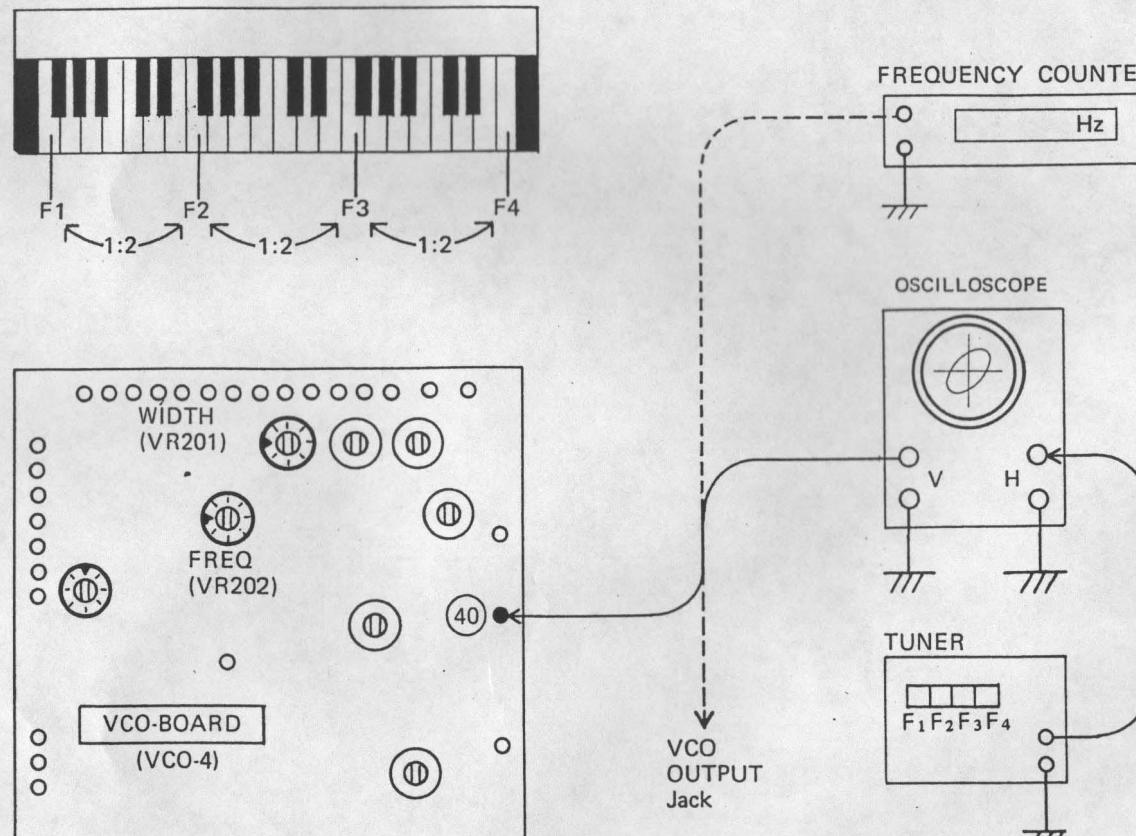

## 3. VCO WIDTH Adjustment:

a) Set the Control Panel as shown below.

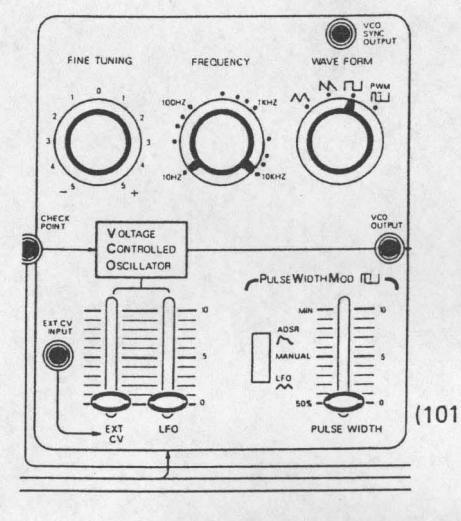

- b) Connect the Oscilloscope or Frequency Counter to Terminal "40" or VCO OUTPUT JACK, and adjust VR201(WIDTH) to have the frequency generations on Keys F1, F2, F3, and F4, become all in octave relations with each other.
- c) When tuned with a Tuner, use VR202 (FREQ.) for adjustment of the frequency of Key F1.

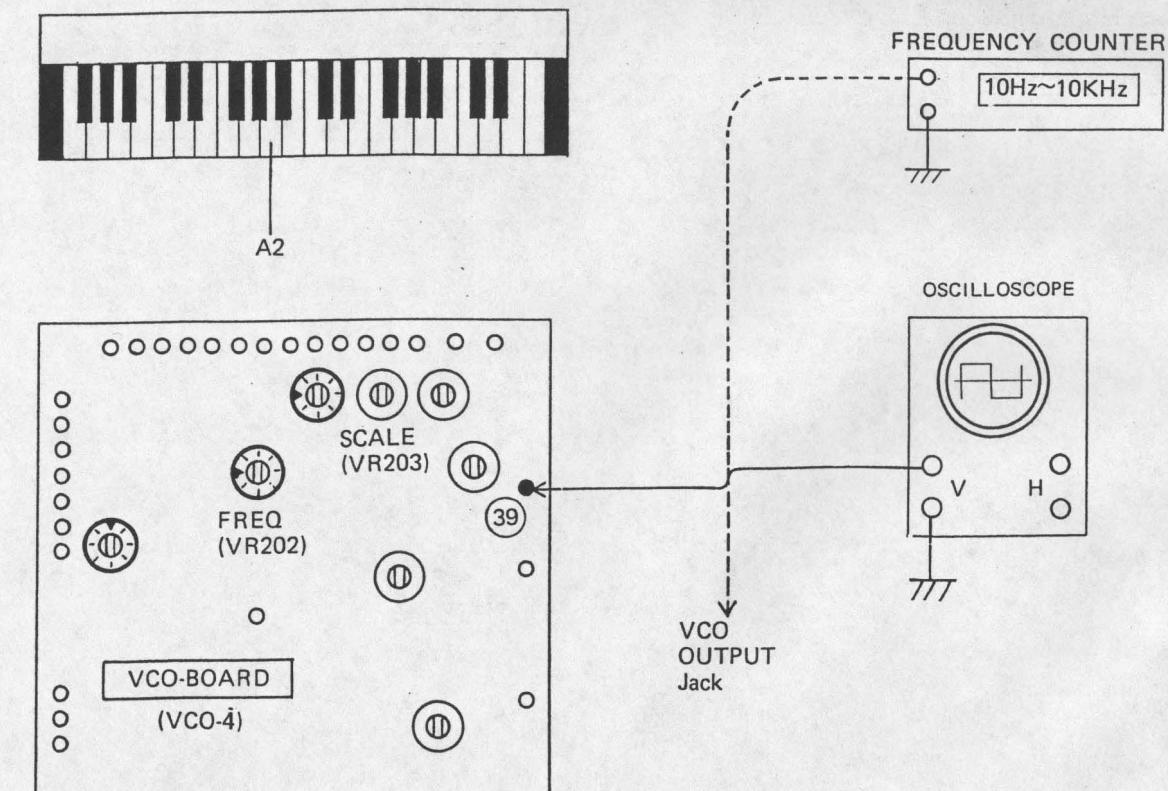

## 4. VCO FREQ. Adjustment:

a) Set the Control Panel as shown below.

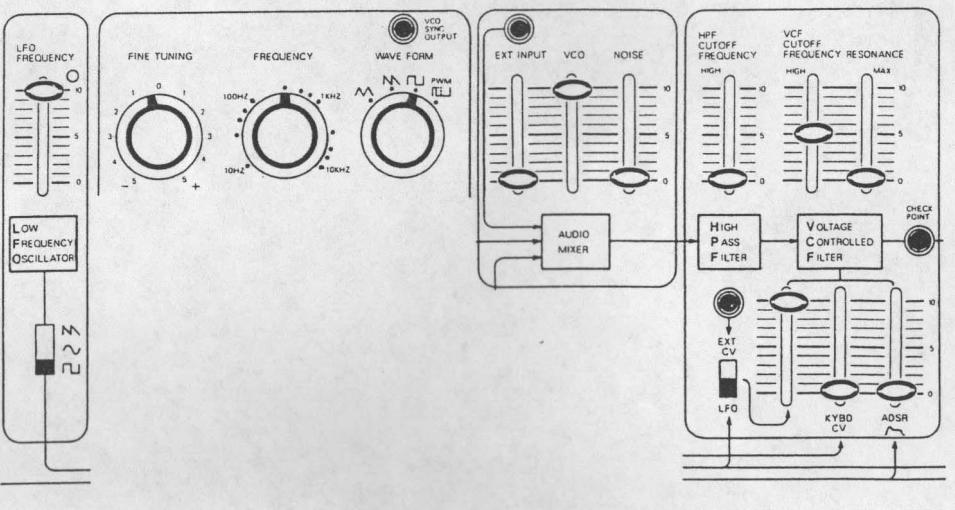

- b) Connect the Oscilloscope or Frequency Counter to Terminal "39" or VCO OUTPUT JACK, and adjust VR202 (FREQ.) to have the frequency generation of Key A2 become 10 Hz (100ms) when VCO-FREQ. knob is turned to point at 10 Hz on the dial.
- c) In the same manner, adjust VR203 (SCALE) so as to have 10 KHz (100 μs) when VCO-FREQ. is at 10 KHz.
- d) Repeat the above b) and c) until the matching of both 10 Hz and 10 KHz are made ascertained.

## VCF ADJUSTMENT

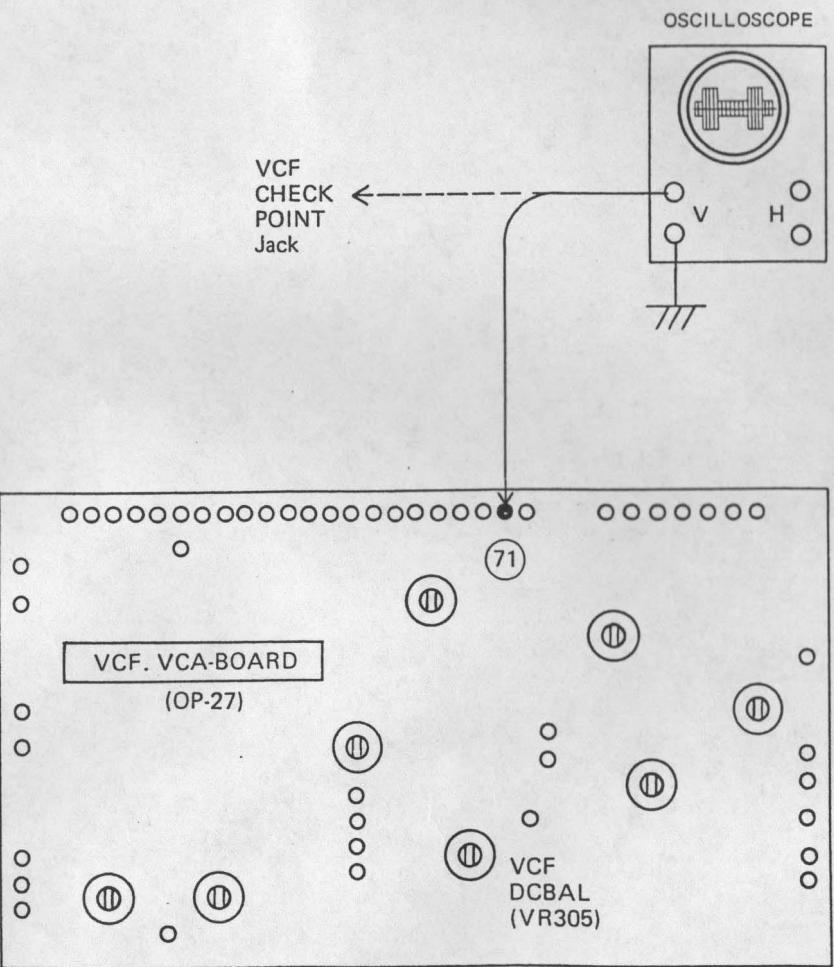

### 1. VCF DC BAL Adjustment:

- a) Set the Control Panel as shown below.

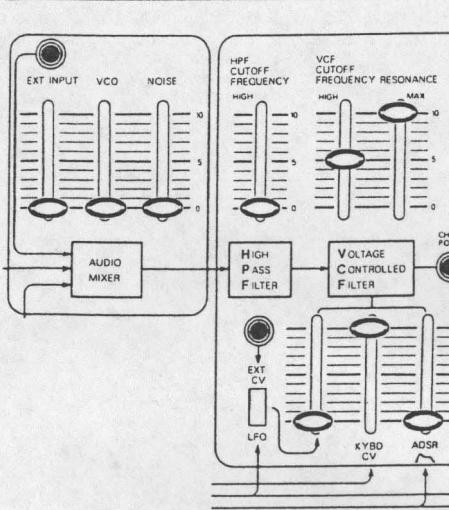

b) Connect the Oscilloscope to Terminal "71" or VCF CHECK POINT JACK on the VCF VCA Board, and adjust VR305 (VCF DC BAL) for the output wave form to be symmetrical in upper and lower sides.

c) Check that the wave form is always balanced when CUTOFF-FREQ. of the Control Panel is turned from 10 to 0.

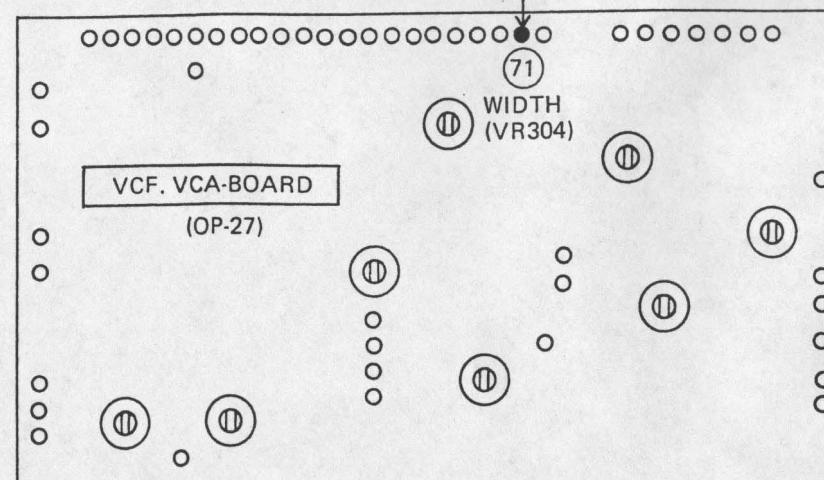

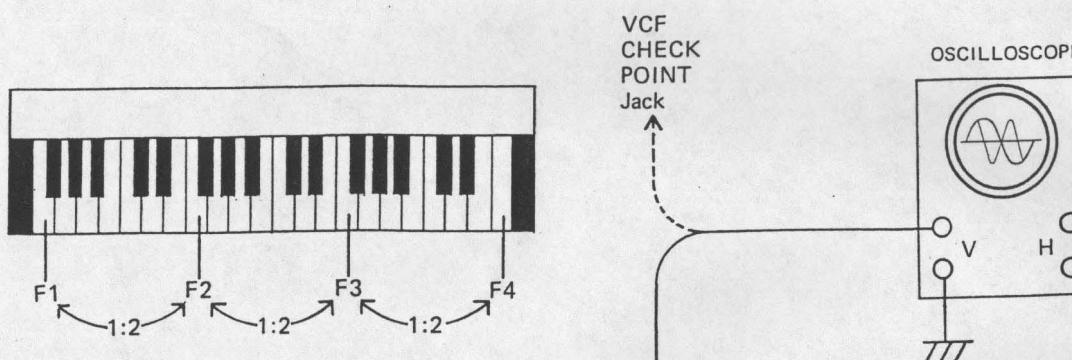

### 2. VCF WIDTH Adjustment:

- a) Set the Control Panel as shown below.

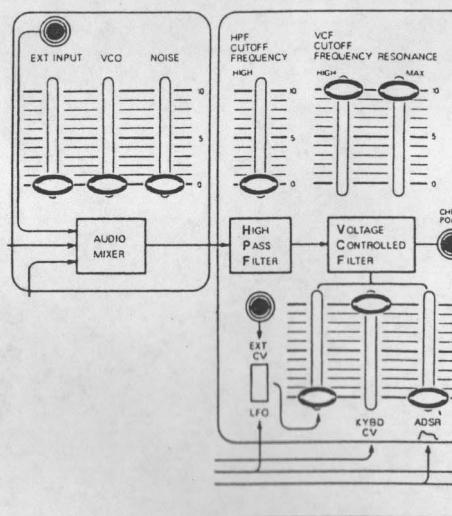

b) Connect the Oscilloscope to Terminal "71" or VCF CHECK POINT JACK, and adjust VR304 (WIDTH) to have the frequency generations of Keys F1, F2, F3, and F4, become all in octave relations with each other.

c) Check that such octave relations remain same all the way when the CUTOFF FREQ. of the Control Panel is being turned from 10 to 0.

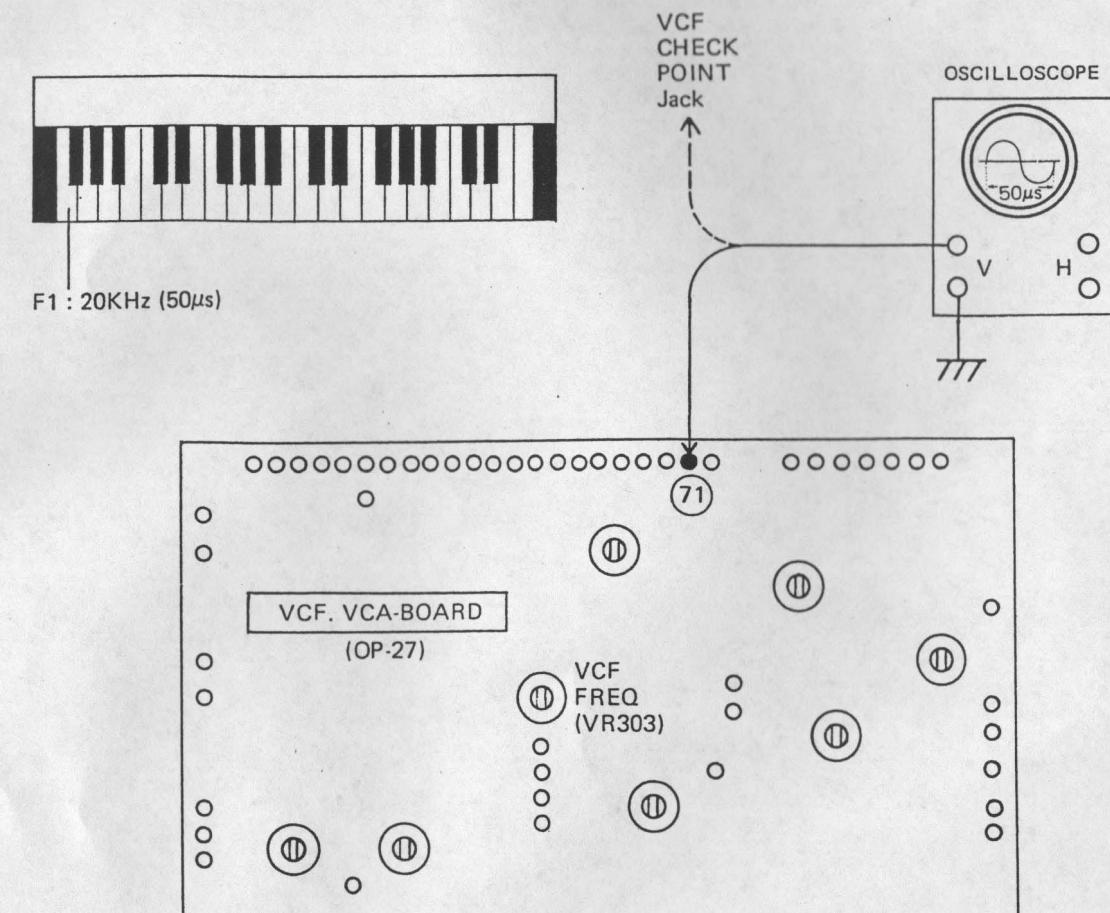

## 3. VCF FREQ. Adjustment:

a) Set the Control Panel as shown below.

b) Connect the Oscilloscope to Terminal "71" or VCF CHECK POINT JACK of the VCF-VCA Board (OP-27), and adjust VR303 (VCF-FREQ.) for the frequency of Key F1 to be 20 KHz (50  $\mu$ s).

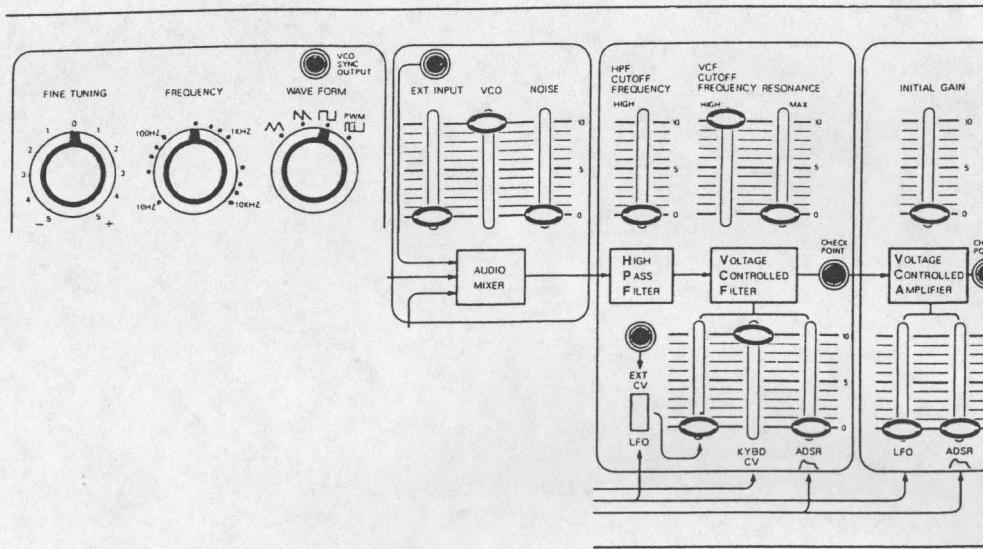

c) Adjustment as above may occasion to disturb the VCF WIDTH Adjustment as once done in (2) herein-before. Repeat, therefore, both adjustments of (2) and (3) until the matching of both WIDTH and FREQ. are made ascertained.

## VCA ADJUSTMENT

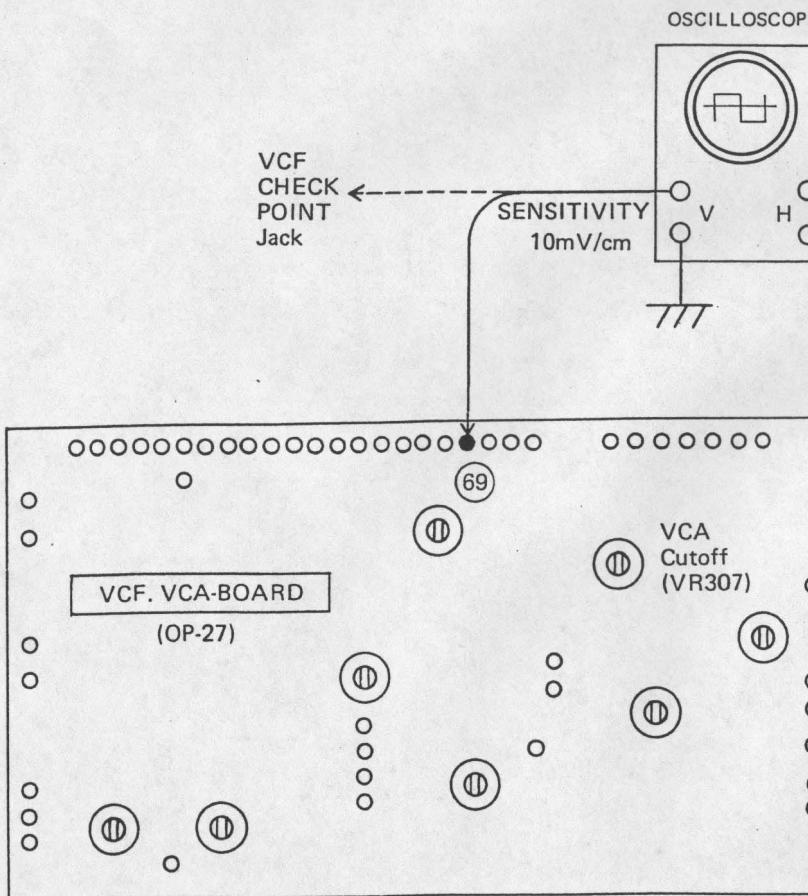

### 1. VCA CUTOFF Adjustment:

- a) Set the Control Panel as shown below.

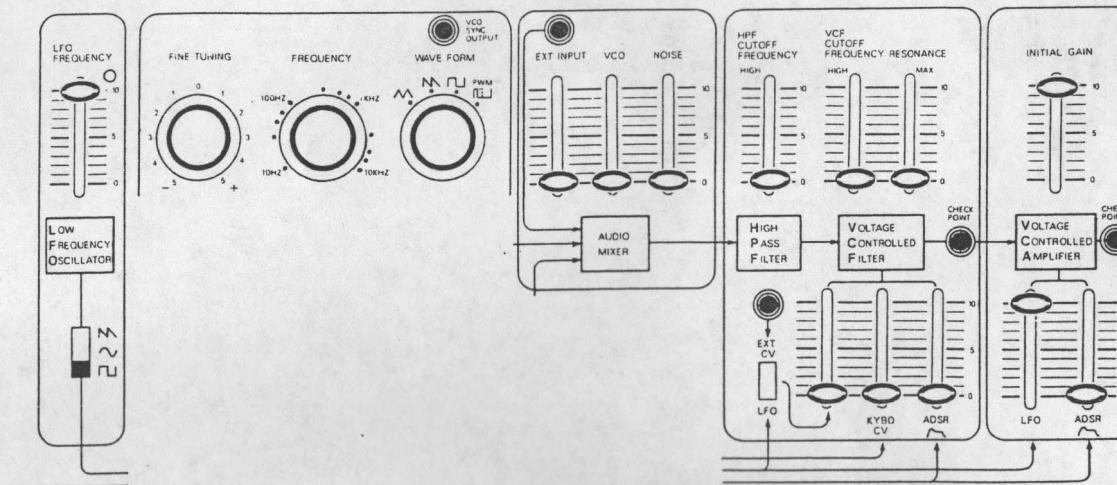

- b) Connect the Oscilloscope to Terminal "69" or VCA CHECK POINT JACK of the VCF VCA Board (OP-27), and adjust VR307 (VCA CUTOFF) to have the cutoff point placed at the point before the output wave form appears on the oscilloscope.

- c) Check that, when the INITIAL GAIN of the Control Panel held to point at 10, the output voltage shall be within 2 Vp-p – 3 Vp-p.

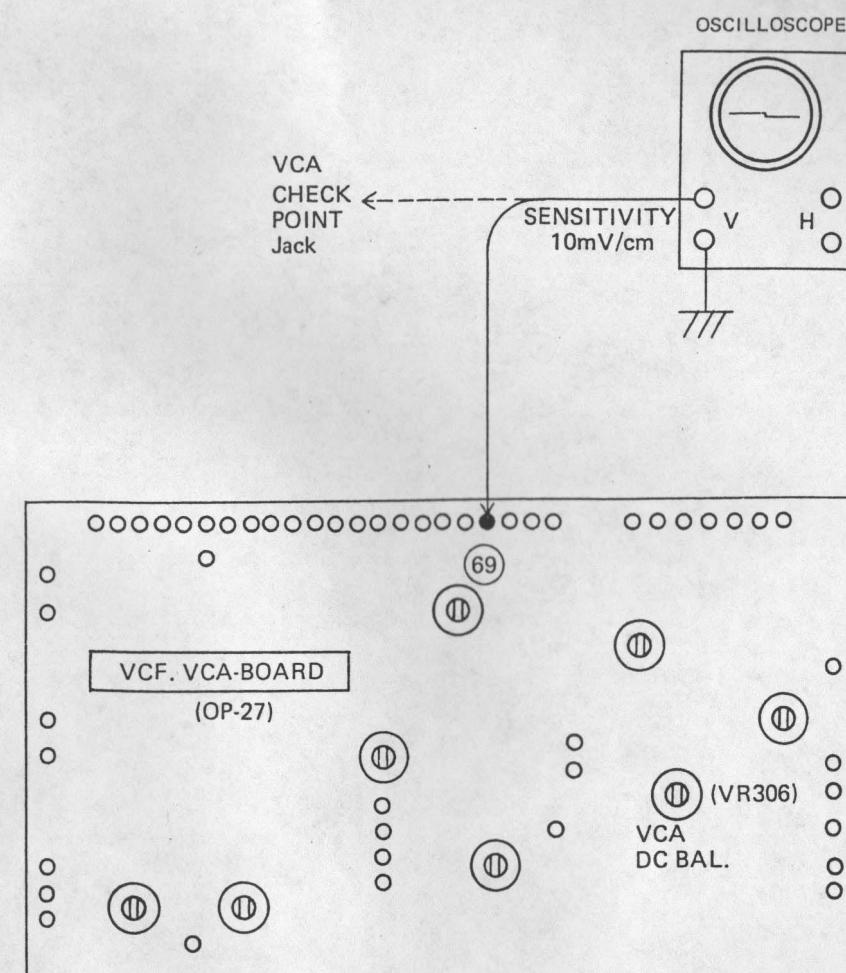

### 2. VCA DC BAL Adjustment:

- a) Set the Control Panel as shown below.

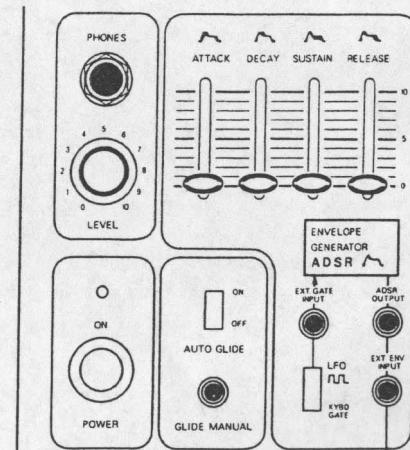

- b) Connect the Oscilloscope to Terminal "69" or VCA CHECK POINT JACK of the VCF VCA Board (OP-27), and adjust VR306 (VCA DC BAL) to have the click appearing on the output as least as possible.

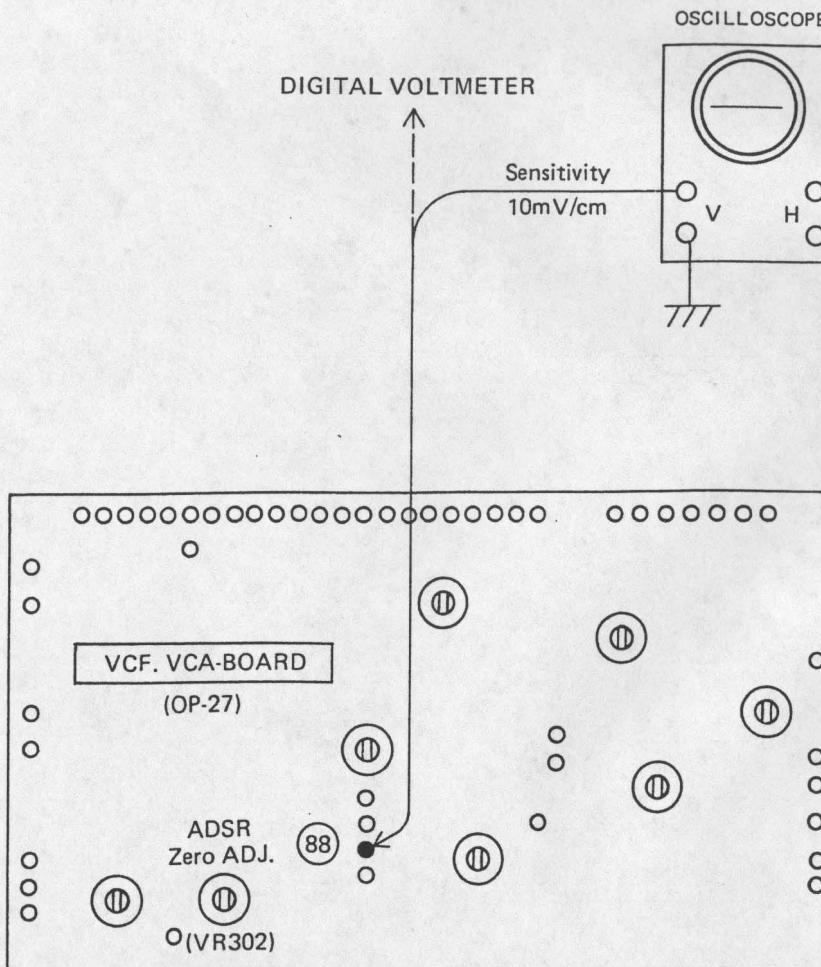

**ADSR Zero Adjustment:**

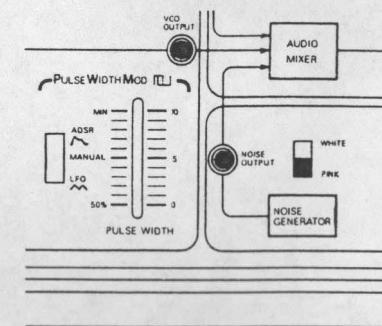

- a) Set the controls of the Control Panel as illustrated below:

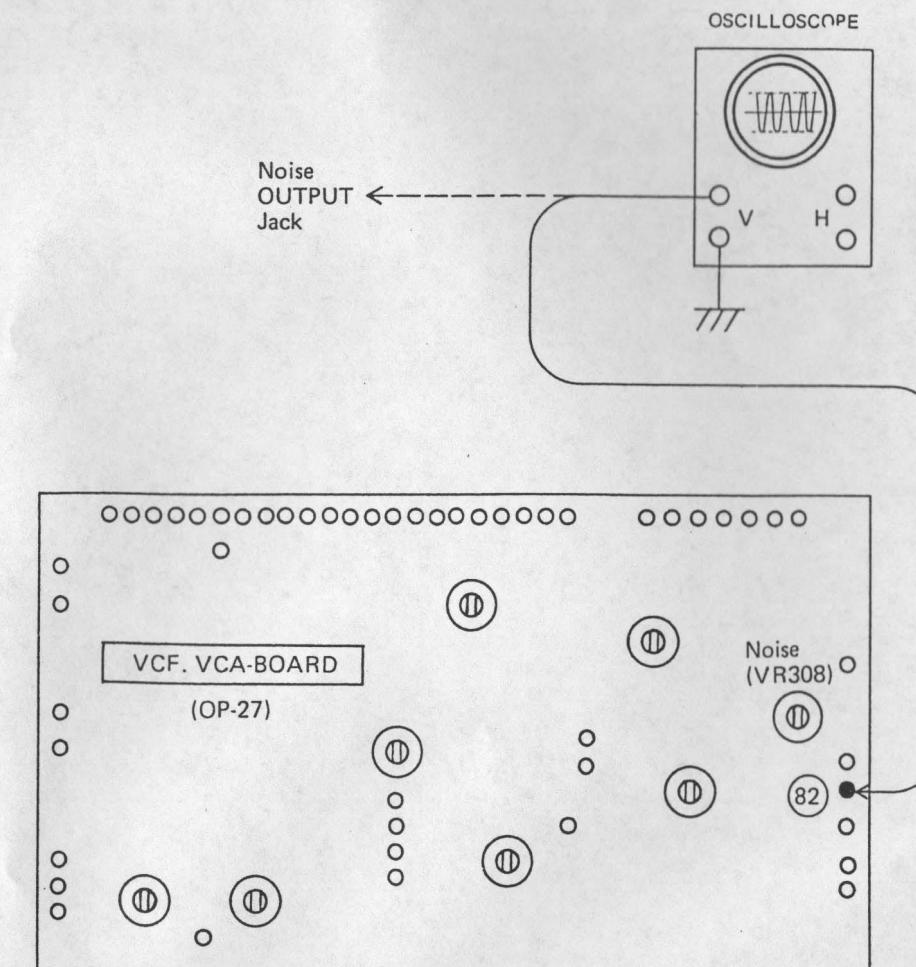

- b) Connect the Oscilloscope, or Digital Voltmeter, to Terminal "88" or ADSR OUTPUT JACK, and adjust VR302 (ADSR Zero ADJ.) for reading of 0V.

**Noise Level Adjustment:**

- a) Turn the Noise Changeover Switch of the Control Panel to PINK as illustrated below:

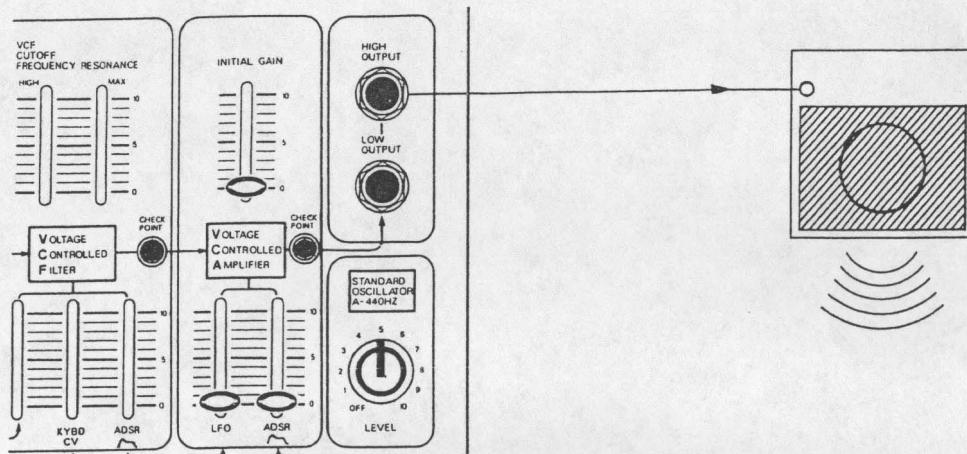

- b) Connect the Oscilloscope to Terminal "82" or NOISE OUTPUT JACK of the VCF VCA Board, and adjust VR308 (NOISE) for voltage reading of 10Vp-p.

**A-440 Hz Standard OSC Freq. Adjustment:**

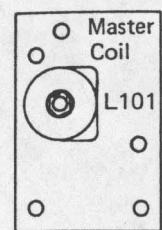

a) Set the Control Panel as shown below, and produce the sound A-440 Hz.

b) Have a Tuning Fork of A-440 Hz set along.

Then, adjust the Master Coil L101 of the 440 Hz OSC Board (OP-30) for zero heat (unison) with the tuning fork.

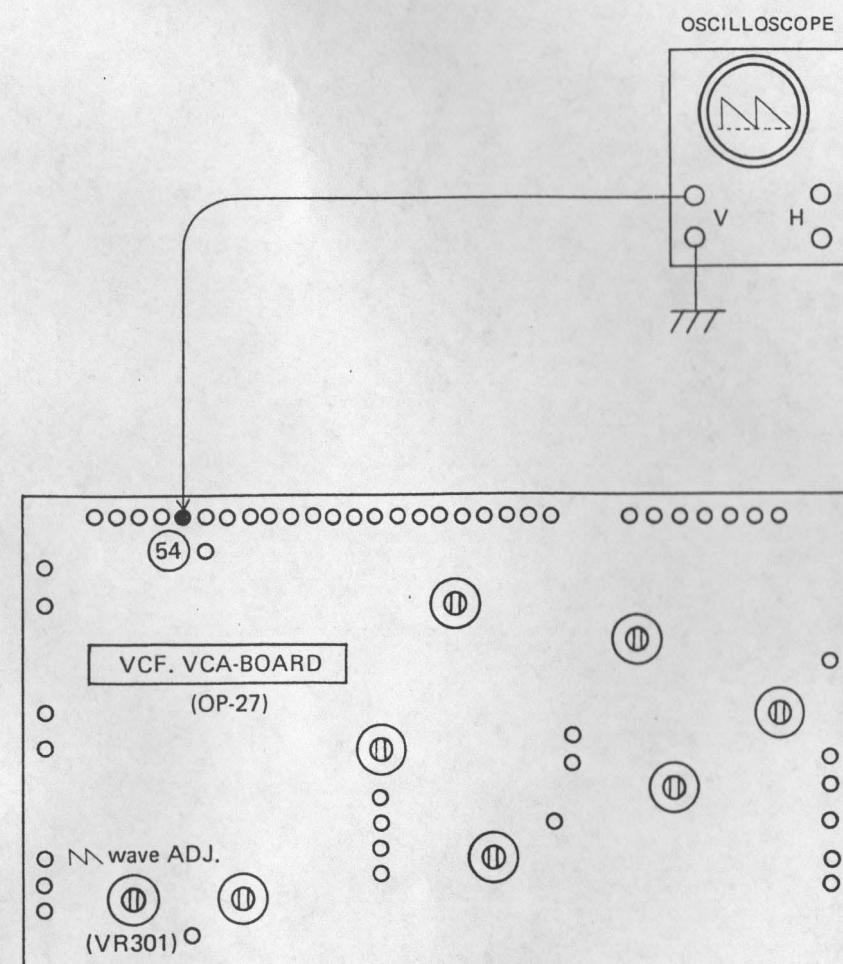

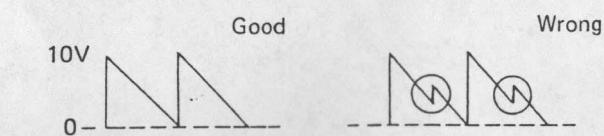

c) In this Coil Adjustment, use always a hexagonal core driver of nonmagnetic type.

Tuning fork

**LFO, Wave Form Adjustment:**

a) Connect the Oscilloscope to Terminal "54" of the VCF-VCA Board (OP-27), and adjust VR301 ( $\cap\cap$  wave ADJ.) so as to have the output wave in a form of Sawtooth.

1976-7-30 SYSTEM100-101

(016-021)

This supplement will help you make perfect adjustment.

\* It is convenient to separate these supplement sheets into sections and attach them to corresponding parts of the first edition.

**SUPPLEMENT  
TO  
SYSTEM 100-101  
AND  
SYSTEM 100-102**

SYSTEM 100-101 – page 18.

**2. Key Control Voltage Adjustment:**

\* Step 2-a) can be completed in the following manner:

a) Depress F1 key and note the voltage ( $V_{F1}$  = approx. 60 – 100mV).

Next with F4 key down, turn VR208 to obtain voltage  $V_{F4}$ :

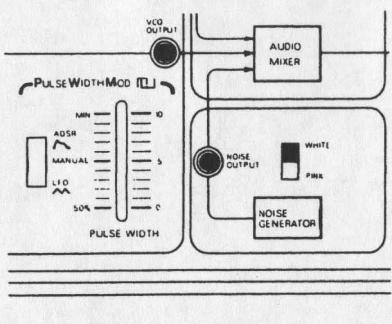

$$V_{F4} = 3V + V_{F1}$$

SYSTEM 100-101 – page 21.

**Noise Level Adjustment:**

\* Step a) may be amended as follows:

a) Turn the Noise Changeover Switch of the Control Panel to *WHITE* as illustrated below:

NOTE: Allow at least five minutes for warming up.

SYSTEM 100-101 – page 23. and SYSTEM 100-102 – page 22.

**VCO ADJUSTMENT**

**1. Triangular (  $\wedge\wedge$  ) Wave Form Adjustment:**

\* Step 1-b) – to be added:

for the output wave form to be in triangular, with C2 key down.

\* Step 1-c) – to be added:

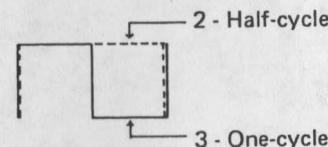

Change Vertical Input Switch from DC to AC. At this time, there should be no vertical swing of the wave form, which can be caused by possible change in 0-level.

SYSTEM 100-101 – page 24. and SYSTEM 100-102 – page 23.

**2. Square (  $\square\square$  ) Wave Form Adjustment:**

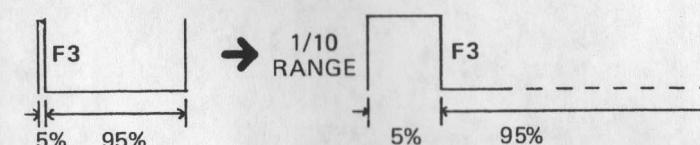

\* Step 2-b) can be completed in the following manner:

With F3 key down, adjust the Oscilloscope so that one-cycle wave form covers the entire surface of the Oscilloscope. Next, with F2 key down, adjust VR207 to obtain half-cycle over the entire surface. This adjustment can be facilitated by quickly and alternatively depressing F3 and F2 keys, which will give the wave forms continuously on the Oscilloscope.

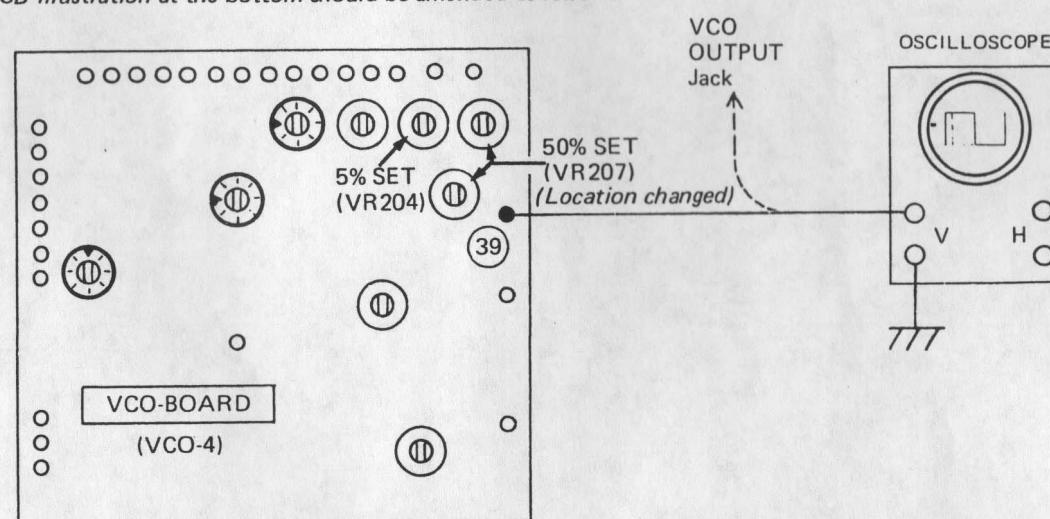

\* Step 2-d) – to be added:

It is recommendable to set sweep range to 1/10 of the former setting for 50%-50% adjustment.

\* PCB Illustration at the bottom should be amended as follows:

NOTE: Allow at least five minutes for warming up.

SYSTEM 100-101 – page 25. and SYSTEM 100-102 – page 24.

**3. VCO WIDTH Adjustment:****\* Step 3-a) – to be added:**

Without sticking to Wave Form setting of  $\wedge\wedge$ , set it to any wave form where frequency deviation appears most significantly.

**\* To practise Step 3-b) do as follows:**

With F1 key down, tune F1 with FINE TUNING. Next, with F4 key down, check to see to which F4 is deviated, higher frequency (sharp) or lower frequency (flat).

If the deviation is too big that judgment is difficult, check it with F2 or F3 key down.

If to higher frequency (sharp), turn VR201 so that F4 becomes even higher (sharper).

If to lower frequency (flat), turn VR201 so that F4 becomes even lower (flatter).

**CAUTION:** If you try to turn VR201 to make F4 frequency closer to true F4 frequency, that is, in the direction to obtain static Lissajous' figure, tuning can never be completed.

Then tune F1 again and follow the step for F4 again. Repeat the procedures until frequencies on F1, F2, F3 and F4 keys are all in octave relations with each other.

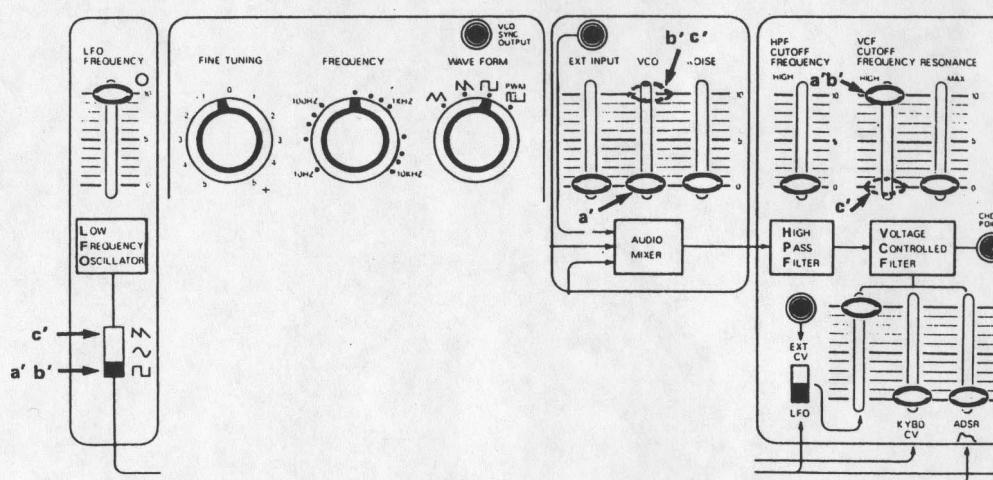

In case F4 is deviated only slightly, tuning can be completed with VCO WIDTH on rear panel, instead of VR201.

SYSTEM 100-101 – page 27. and SYSTEM 100-102 – page 26.

**VCF ADJUSTMENT****1. VCF DC BAL Adjustment:****\* Step 1. VCF DC BAL Adjustment can also be made in the following procedures.**

a') Connect the Oscilloscope to Terminal "71" on the VCF VCA Board or VCF CHECK POINT JACK, and set the range to 0.5V/cm.

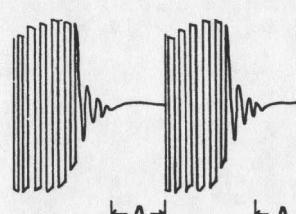

Set the Control Panel as shown below, and adjust VR305 so that leakage square wave from LFO is minimized.

b') Change VCO setting to "10" and make sure the wave form is vertically symmetrical on the whole.

c') With VCO setting to "10" as it is, change VCF CUTOFF FREQUENCY to "0" and LFO wave form to sawtooth ( $\wedge\wedge$ ).

For perfect adjustment, fine-adjust VR305 so that inclination of A section is minimized.

NOTE: Allow at least five minutes for warming up.

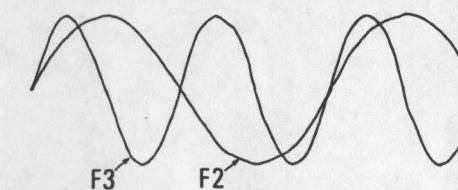

SYSTEM 100-101 – page 28. and SYSTEM 100-102 – page 27.

**2. VCF WIDTH Adjustment:****\* To practise Step 2-b), do as follows:**

With C2 key down, adjust VCF CUTOFF FREQUENCY to obtain 1KHz oscillation on the Oscilloscope.

Then, with F3 key down, adjust the Oscilloscope to obtain 3-cycle wave form on the Oscilloscope.

Next, depress F3 and F2 keys alternatively and quickly and turn VR304 to attain octave-relation between the two keys.

NOTE: Allow at least five minutes for warming up.
